Alexey Efimov

Senior iOS Developer | Lead iOS Developer

Available to start immediately

PROFESSIONAL SUMMARY

Senior iOS Developer and current Lead iOS Developer with a hands-on focus on product engineering, architecture, and reliable delivery. Builds and modernizes production applications with Swift, SwiftUI, and UIKit, personally owns complex and UI-heavy work, designs architecture changes, and develops testing and release infrastructure. In a two-person iOS team, managed the other developer while remaining the primary implementer for complex features and coordinating delivery across product analysis, design, backend, Android, and QA.

CORE SKILLS

- Swift, SwiftUI, UIKit, Observation, Swift Concurrency, URLSession
- MVVM-C, Coordinator, dependency injection, service and repository layers, DTO/domain mapping
- Core Data, SwiftData, UserDefaults, local persistence, and offline workflows
- CallKit, VoIP push handling, application lifecycle, session protection, and passcode locking
- Matrix, Matrix Rust SDK, messaging, and timeline architecture
- Unit, snapshot, UI, and accessibility testing
- GitLab CI/CD, Fastlane, TestFlight, release automation, and Sentry
- Architecture, code review, decomposition, estimation, prioritization, and pre-QA validation
- Cross-functional delivery across product analysis, design, backend, Android, and QA

PROFESSIONAL EXPERIENCE

Quantron Systems - Lead iOS Developer

August 2025 - Present

- In a two-person iOS team, managed the other developer and owned planning, architecture, code review, releases, and cross-functional coordination while personally implementing the most complex and UI-heavy work.
- For Qonnect, a secure Matrix-based messenger, built search across previously unloaded message history, per-file sharing and forwarding from media groups, bulk unpinning, and reliable navigation to messages outside the current timeline window.
- Hardened VoIP and CallKit handling by eliminating hanging system actions, isolating concurrent incoming-call state, and validating the redesigned lifecycle with 65 unit tests.
- Implemented session protection and passcode locking across background, inactivity, and screen-off transitions while preserving active calls and preventing transient authentication failures from deleting local sessions or encryption keys.
- Completed the application-wide migration to Observation, eliminating a rendering regression and an asynchronous race and validating the affected area with 92 tests; separately designed type-safe feature availability for three application flavors with compile-time completeness checks.
- In response to a manager-initiated need for CI/CD, defined the technical scope and designed and implemented automated checks, separate unit and snapshot jobs, QA and production TestFlight delivery, explicit signing, and curated release-note assembly.
- Restored nightly UI and accessibility quality gates, stabilizing 42 UI tests and 215 accessibility tests and reducing the primary diagnostic artifact from 121 MB to 24 KB plus targeted failure attachments.
- Built a Swift source dependency-based UI test impact analyzer and integrated it into precommit and CI; the tool has 30 automated tests and was validated against nine previously merged branches.
- Moved 238 verified Qonnect issues to Resolved from January through October 2026; 83.6% had no QA return after the first submission, and 96.6% required at most one iteration.
- For Avtoban, a mobile app for road-construction automation, established an end-to-end delivery process spanning decomposition, architecture, code review, and pre-QA validation; of 76 verified issues personally moved to Resolved, 75% had no return after the first submission and 96% required at most one iteration.
- Established MVVM-C engineering standards and led the incremental modernization of a large UIKit application, migrating key catalog, settings, and shift-reporting flows without a big-bang rewrite.
- Built the iOS side of an end-to-end integration between Avtoban and an external telematics system, covering machinery-session loading and filtering, bulk assignment to construction elements and job types, local persistence, validation, and backend synchronization.
- Conducted two Middle iOS Developer technical interviews and recommended one candidate.

Quantron Systems - iOS Developer

June 2025 - July 2025

- Delivered product work and legacy UIKit modernization for Avtoban, a mobile app for road-construction automation, before promotion to Lead iOS Developer.
- Restored offline continuity with cached organizational context and reliable startup without connectivity; simplified shift reporting by replacing sequential per-subdivision operations with batch actions and removing obsolete constraints.

SwiftBook - Technical Curriculum Author, Principal Instructor, and Academic Lead

April 2018 - 2025

- Created and continuously evolved the six-module, 48-lesson technical curriculum of the six-month flagship iOS Developer from Scratch course, covering Swift, UIKit, networking, concurrency, persistence, architecture, SwiftUI, and SwiftData.
- Personally taught approximately 40 of 46 cohorts and led invited instructors who used his technical curriculum.
- More than 1,000 students had graduated by 2021; graduates reported finding iOS work, including individual cases during the course.
- Continued teaching for approximately two months after joining Quantron solely to complete the final cohort already in progress.

Head of Software Department

August 2011 - 2012

- Led a four-person software department, improved internal processes and document flow, expanded the branch offering, and launched a new consulting service.

Enterprise Automation Project Manager and Systems Analyst

2000 - 2010

- Led a project team of three developers and one methodologist, owning requirements, specifications, developer tasking, implementation, testing, user training, and client coordination.
- Contributed to large enterprise, industrial, and public-sector automation programs as a project manager and lead systems analyst.
